 CoCo SDC Firmware Patch 116
==============================
```

This is a patch for the micro controller firmware in the CoCo SDC.

The patcher requires that the MCU already be programmed with
version 115 of the firmware. It applies changes to upgrade the
firmware from version 115 to version 116.

The only difference between the two versions is that 116 will
recognize VDK disk images with header sizes ranging from 12
to 256 bytes, whereas version 115 only recognizes headers with
exactly 12 bytes.

The patch is provided as a VDK disk image for use with a Dragon.
You will need to have the DOS Plus Extender for the CoCo SDC
programmed into one of your flash banks.

Copy the PATCH116.VDK file to an SD card and insert the card
into the socket on the CoCo SDC. Boot the Dragon with the
CoCo SDC connected directly to the cartridge port. Do not use
a Multi-Pak Interface or Bus Expander.

Mount the disk image by entering:
    SDRIVE 1,"PATCH116.VDK"

Run the patcher utility by entering:
    RUN "PATCHER"

The utility will display the current version number of the
SDC firmware and ask if you wish to continue. Press the [Y]
key to proceed. The patch data file will be loaded and its
checksum verified. You will then be asked to press the [Y]
key again to confirm that you want to apply the patch.

After the patch is applied the Dragon will re-boot. You can
mount the disk image and run the patcher again to see if it
displays 116 as the new firmware version.
